

NPD's New Foam Equipment and Product Technology

Has You Covered.... Inside and Out!

Inside...

- Foam applications provide a superior method in the treatment of drains and micro-habitats containing organic matter, delivering results where liquid treatments just can't reach
- Foam will expand in a void, gallery or pipe and fill 360 degrees of that space transporting the active product into crevices and leaving no area untouched
- Foam treatments also provide increased surface contact time and the surfactants in the foaming agent reduce surface tension of the treated areas, allowing deep penetration into the organic matter
- Drain Flies feed and breed in the organic slime that coats the inside of floor drains, particularly the top and sides of pipes and places such as the hollow legs of prep tables and drip lines behind bars
- Drain flies also deposit their eggs in this organic slime, providing their larvae with a plentiful food source...unless the entire pipe or void is cleaned thoroughly with a slime eating bacteria, they will multiply rapidly
- Your technician can assess conditions in your facility and provide a service plan proposal and quote
- Moderate to severe problems might require an initial month of weekly treatments, followed by a month of bi-weekly treatments and as the situation comes under control, a monthly maintenance program for on-going preventative management

Foam can reach the organic matter that collects in areas like the top and sides of pipes and in the hollow legs of prep tables

NPD's New Foam Equipment and Product Technology Has You Covered.... Inside and Out!

Outside...

- Foam applications provide a superior method in the treatment of dumpsters, compactors, restaurant floors and supermarkets...any area requiring cleaning, degreasing and odor control
- Foam applications provide increased surface contact time and the surfactants in the foaming agent reduce surface tension of the treated areas allowing the active product to penetrate deeply into organic waste and grime
- Eliminating odors and organic waste play a major role in solving many pest control problems as the odor of pest feces and pheromones as well as organic waste are a strong pest attractant
- Your technician can assess conditions in your facility and provide a service plan proposal and quote
- Moderate to severe problems might require an initial month of weekly treatments, followed by a month of bi-weekly treatments and as the situation comes under control, a monthly maintenance program for on-going preventative management

Your technician will Complete Foam Treatments of all Sections of Dumpsters or Compactors, Inside and Out, all Surrounding Floor and Wall Areas, all Dormant Spillage Puddles and Loading Ramps for maximum results.
